

Figure 1 illustrates the phenotypic differences between *Lotus japonicus* and *Hordeum vulgare* under different nutrient treatments. The figure is divided into two main sections, one for *Lotus japonicus* (wild-type) and one for *Hordeum vulgare* (wild-type). Each section shows three pots labeled NPK, PK, and UF. The *Lotus japonicus* plants are smaller and have more leaves, while the *Hordeum vulgare* plants are taller and have fewer, larger leaves. Dashed outlines indicate the growth of the plants over time.
